

Signature Assignment- Digital Storyline

Assignment Overview

The Signature Assignment for ENG4114 Literature & Film will be a Digital Storyline. This will be an AI-driven structure to guide students as they plan their adaptation outline for the final project. The idea of this is similar to an interactive narrative, where instead of engaging in different possibilities for a reader it helps the author explore different scenarios, perspectives, or outcomes from the original source material. Using their original source material, this program acts as a guideline of all elements that make an adaptation successful. Students will change the story to fit their new adaptation, while acknowledging what is still present from the original. This tool also helps students establish cultural significance, historical context and representation of the original story and how it will be presented in the new way.

The goals of this project align with the main learning objectives of this course. Students will demonstrate knowledge of adaptation theories and apply them as their outline comes to life. They will also examine how historical and cultural significance plays a part in adaptations as they find connections for their own new storyline.

Context for Delivery

The context for delivery will be findings from the other AI-driven tools that have been discussed previously, such as the Study Guide application and the Visual Interactive Explorer. With the study guide, students have collected a lot of research on their original source material and have performed text analysis to find themes and significance. They have used the “Planning My Adaptation” tab with its guided prompts to find elements such as perspective and tone or fidelity. From here, they can input all of this new information into their digital storyline to visualize how they will alter the course material. Additionally, students can use findings from the Visual Interactive Explorer, which delivers visual ideas based on the book covers of the source material. This is helping students realize how literature can be reworked for visual media, with particular attention to representation and style.

Rubric & Grading Criteria

The rubric for this project is as follows:

- Content & Proof of Knowledge: 70%
 - This assignment is mainly focused on creating a rough draft outline for the final project so most of the information gathered here is what students will use from here on out. The content portion of this assignment is more heavily graded to prove what has been learned regarding adaptation theories and how they will be applied moving forward.

- Organization & Presentation: 20%
 - While students are using the agentic tool as a guided structure for this project, what they've learned should be clearly displayed and explained in the sections.
- Grammar & Mechanics: 10%
 - Spelling, grammar, and punctuation is encouraged but not necessary since the focus is on the content and research before this gets developed into a final product.

Examples of Successful Work

Here is an example of a template found from [slideteam.net](https://www.slideteam.net) that can be a model for the project. Not all the elements will be included and they will be more geared towards adaptation theories. While this is geared towards creating digital presentations, this is an example of something effectively used for developing an immersive narrative.

I sent this to Claude to help me visualize a version of this template for my course:

Digital Storyline

Seven elements that turn a sequence of facts into a story worth watching.

I wanted each element to represent either a theory of adaptation or an element of storytelling that takes students through this process. They should explore what point of view their adaptation takes place in, the characters involved, the motivations of these characters and/or reasons for different story arcs, any emotional connection and how this affects audience perspective, historical or cultural significance and the context of the story, the soundtrack and tone for effect, and any symbolic additions that deepen the story. This tool really breaks down all aspects of creating an adaptation from literature and guides students on ensuring each element is included. It also helps prompt them on elements they might be struggling with so that nothing is left out.

AI Guidelines & Usage

Seeing as we have used AI-driven tools a lot in this course, it is important to keep in mind the personal examples and established knowledge students already have and ensure it is clearly displayed. While these tools help with research, note-taking, and analysis, students should have their own background knowledge of the source materials and text readings to guide them. That being said, students can include screenshots from their Visual Active Explorer that have helped them gain ideas for their storyline as well as prompts from Study Guide app with their textual analysis notes. AI tools for textual and visual analysis have been huge components of this course and students will continue to use the prompting guides from these to develop their final project. Additionally, a brief explanation of what was derived from these tools should be expressed as well as any limitations or issues experienced.
